FLAT VOICE COIL MOTOR FROM GEEPLUS TILTS ON ONE AXIS

A new very low profile flat voice coil motor from Geeplus Europe is designed in such a way that it offers good clearance in assembly and has latitude for tilting on one axis.

Providing 2N continuously at 3 to 4W with a power consumption rate of 6.5W, the 01-1225 exhibits very good linearity of force over operating displacement. Ideally suited for use in multiple axis applications, such as moving optical filters, it is possible for the device to stack several coil assemblies within the same magnet assembly, giving the designer total flexibility in choosing the exact requirements to suit the application.
